

AutoDrive Motors Pvt. Ltd.

Warranty Claims Policy Manual

Effective Date: January 1, 2026 | Version: 2.0 | Confidential – Internal Use Only

Purpose

This manual establishes standardized rules for evaluating, validating, investigating, approving, rejecting, and escalating automobile warranty claims. It is designed to support consistent claims handling across authorized dealers and service centers while providing clear controls for suspected fraud.

1. Claim Submission & Documentation Requirements

Mandatory documents

- Every claim must include a valid customer invoice or purchase record showing the purchase date, vehicle identification number (VIN), and customer identifier.
- A service-center job card or repair order must be attached when repair activity has taken place.
- At least one supporting image must be provided for a physical component claim. Images should clearly show the claimed component and, where practical, its condition or identifying markings.
- The claim must identify the failed component, reported failure symptom, diagnosis, requested repair or replacement, parts cost, and labor cost.
- For replacement of a major component, the dealer should retain the removed component or other evidence sufficient for inspection when requested.

Documentation exceptions

- Missing mandatory documentation does not automatically establish fraud. The claim must be placed into manual review until the missing evidence is resolved.
- Documents with conflicting VIN, vehicle model, customer, dealer, or repair information must be treated as a potential integrity issue and investigated.

2. Warranty Eligibility & Coverage

Coverage period

- Passenger cars and light commercial four-wheelers: 365 days or 20,000 km from the warranty start date, whichever occurs first.
- Two-wheelers: 180 days or 10,000 km from the warranty start date, whichever occurs first.
- The applicable odometer reading must be recorded at the time of claim submission or repair.

Eligibility conditions

- The vehicle must be within both the applicable time and mileage limits at the time the failure is reported.
- The claimed component must be an original manufacturer part or an approved replacement recognized by AutoDrive Motors.
- Warranty coverage may be denied where the failure is directly attributable to excluded damage, unauthorized modification, misuse, or non-approved repair activity.

3. Covered Components & Exclusions

Four-wheelers

- Brake pad assembly
- Airbag system components

- Fuel pump
- 12V battery
- Vehicle sensors
- Engine control unit (ECU)
- Alternator

Two-wheelers

- Brake pad assembly
- Battery
- Vehicle sensors
- Headlight assembly
- Starter motor

General exclusions

- Paint, upholstery, glass, wiper blades, cosmetic deterioration, and ordinary wear-and-tear items.
- Accidental or collision damage unless specifically covered under a separate program.
- Damage caused by unauthorized modifications, non-approved accessories, racing or competitive use, or improper repair.
- Failures caused by consumables or maintenance items where the failure represents normal service-life depletion rather than a manufacturing defect.

4. Cost, Labor & Approval Controls

Labor limits

- Maximum labor reimbursement per claim: USD 250 for two-wheelers and USD 500 for four-wheelers, unless an approved exception applies.
- Labor charges must be reasonably related to the documented repair operation and supported by the job card.

Total claim thresholds

- Any claim with total requested cost above USD 1,000 requires management approval before final settlement.
- A claim submitted within 30 days of vehicle purchase with a total requested cost above USD 500 must be treated as a heightened-risk claim and routed for additional review.
- Repeated repairs of the same component within a short period should be reviewed for duplicate billing, unresolved root cause, or potential abuse.

5. Fraud & Anomaly Indicators

Customer-level indicators

- Three or more prior warranty claims within the applicable review period should trigger enhanced review.
- Multiple claims with similar descriptions, identical failure narratives, or unusually short intervals between repairs should be examined.
- Repeated claims shortly after previous repairs may require confirmation of the prior repair outcome.

Dealer/service-center indicators

- Unusually high claim frequency or claim value compared with comparable dealers may require investigation.
- High rates of claims for the same component, unusually high labor charges, or repeated use of identical repair narratives should be reviewed.
- Claims containing repeated document patterns, inconsistent timestamps, or suspiciously similar supporting evidence should be escalated.

Claim-level indicators

- Expired warranty by time or mileage.
- Missing invoice, mismatched VIN, inconsistent vehicle details, or conflicting customer information.
- Claimed component not matching the vehicle configuration or documented repair.
- Evidence suggesting accidental damage, unauthorized modification, or non-approved parts.
- Duplicate or substantially overlapping claims for the same failure or repair event.

6. Multi-Agent Decision & Risk Framework

Policy Checker

- Validates warranty period, mileage, component coverage, documentation requirements, exclusions, and cost thresholds.
- Outputs policy findings and identifies missing or conflicting information.

Fraud Scoring Agent

- Calculates a fraud-risk score between 0.00 and 1.00 using documented claim characteristics and detected indicators.
- The score is a risk signal and must not be treated as proof of fraud by itself.

Evidence Collector

- Reviews claim documents, images, repair descriptions, historical information, and detected anomalies.
- Summarizes supporting evidence, contradictions, and unresolved questions for downstream decision-making.

Action Agent

- Combines policy findings, risk signals, and evidence into a recommended disposition: Approved, Rejected, or Escalated for Human Review.
- Any unresolved ambiguity, material documentation conflict, or mandatory escalation condition must be routed to human review.

7. Decision Rules

Approve

- The claim satisfies applicable coverage requirements, required evidence is present, no material exclusion applies, and no mandatory escalation condition is triggered.

Reject

- The claim is demonstrably outside warranty coverage, concerns an excluded item or condition, or contains a confirmed policy violation that prevents reimbursement.

Escalate – Human Review

- Documentation is missing or materially inconsistent.
- The claim exceeds management approval thresholds.
- Fraud indicators are significant or contradictory evidence remains unresolved.
- Coverage cannot be determined confidently from the available evidence.
- The claim requires an exception to standard policy.

8. Human-in-the-Loop (HITL) Review

- A designated warranty reviewer has final authority for escalated claims.
- The reviewer should record the decision, rationale, evidence considered, and any approved exception.
- The reviewer may request additional documents, physical inspection, dealer clarification, or customer verification before making a final decision.

- Automated agent recommendations are advisory and do not replace authorized human approval where HITL review is required.

9. Audit, Traceability & Record Retention

- Each claim must retain an auditable record of submitted documents, extracted claim fields, policy checks, fraud indicators, agent outputs, escalation events, reviewer actions, and final disposition.
- Agent decisions should be traceable to the evidence and policy rules used to produce them.
- Changes to claim information after submission should be logged with timestamp, user identity, and reason for change.
- Warranty records should be retained according to AutoDrive's applicable legal, contractual, and records-management requirements.

10. Operational Controls & Data Quality

- VIN values should follow the expected vehicle identification format and be validated against available vehicle records.
- Mileage must be numeric and logically consistent with previous recorded readings where historical data is available.
- Dates must be validated for logical order: purchase date, warranty start date, repair date, and claim submission date.
- Currency and tax treatment must be explicitly identified so claim values are not compared across inconsistent units.
- Where data quality prevents reliable evaluation, the claim must be escalated rather than automatically rejected.

11. Policy Governance

- This policy is owned by the Warranty Operations function and should be reviewed at least annually or when material changes occur to warranty programs.
- Policy changes must be versioned and communicated to authorized dealers and service centers before becoming effective.
- Exceptions to this manual require documented authorization from the designated warranty management authority.

Important: This is a synthetic policy manual created for demonstration and testing of the WarrantyShield AI multi-agent application. It is not a legal warranty contract and should not be used as an actual automotive warranty policy without review and approval by the relevant legal, compliance, warranty, and business teams.
